

Meters updated to new technology

Ripley Power and Light Company continues to work across its system to change out all of its electric meters to the latest technology.

Customers in Gates, Halls and Henning have received the new meters. The utility will be in the Curve area next as it works its way towards Ripley.

Everyone in Ripley Power and Light's service area should see their meter switched out over the course of the next three years.

The new meters support efficient 1-byte pinging for use with fault detection and software applications that proactively monitor outage and restoration events.

"It's important to keep our meters updated to the latest technology," said Ripley Power and Light President and CEO Mike Allmand. "This allows us to continue to give our customers the best electric service possible."
